

(a) Donor availability at the same target

Paired comparison: same test trials and decoder

$$\Delta = \text{AUC}_{\text{LOSO}} - \text{AUC}_{\text{EXP}}$$

(b) Analysis populations

Later donor available (primary)

$t = 1, \dots, T - 2$; at least one later donor

All origins (sensitivity)

$t = 1, \dots, T - 1$; final origin has $\Delta = 0$
